

In my theoretical movie theater point of sales system I would want to track a few things: staff, movies, customers, tickets, concessions.

Staff: recorded on transactions and to track who is working in what theater

Movies: recorded on the schedule to see what theater it is in, also linked in tickets to track ticket sales

Customers: keyed in tickets to see who is buying tickets to what as well as in concession transactions

Concessions: a menu table holds all the product info for each concession and a separate table holds concession transactions
